1. Setup when you run the code (flag is in the dimensions of the actual American Flag):

(In the terminal, it gives a game description: “Welcome to the Flag Game. Guess a number between number 1-10 to choose the color(s) of the American Flags stripes, banner, and stars. Choose the correct combination of numbers to color the American Flag correctly. Remember, the right answers don't change, so once you get it right, keep the same number. Good luck!”)

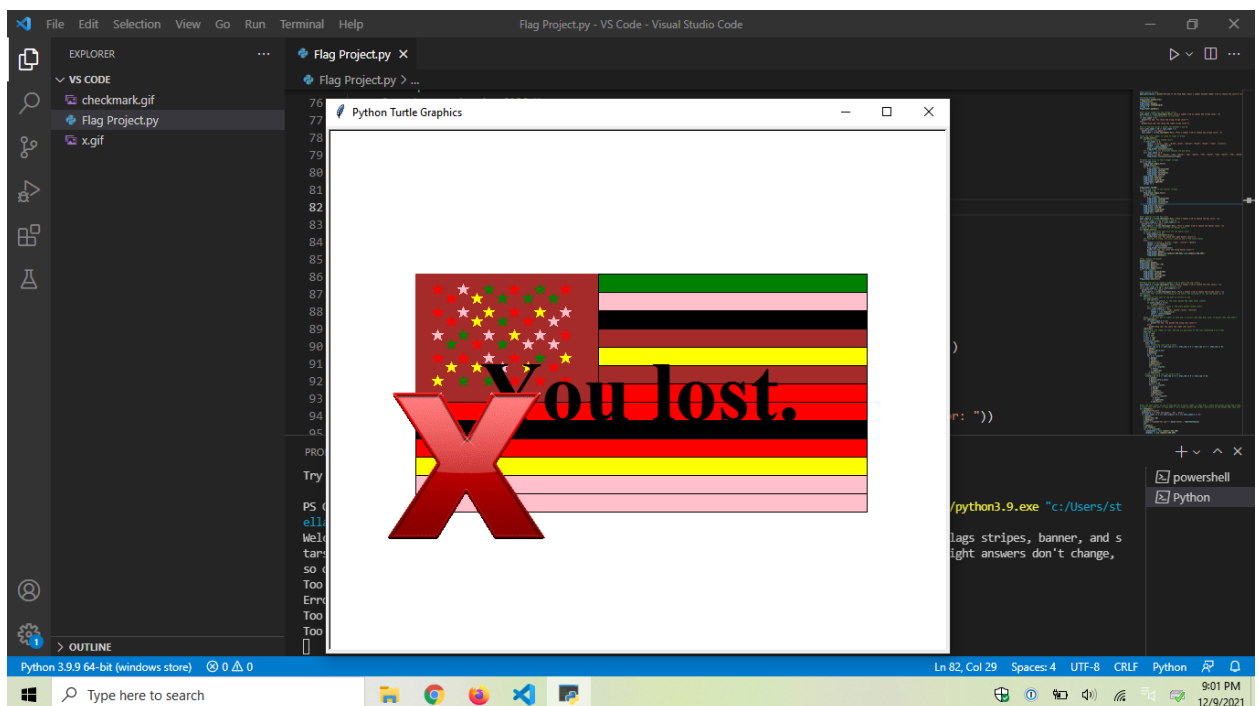

2. What happens if you input a number less than 1 or greater than 10:

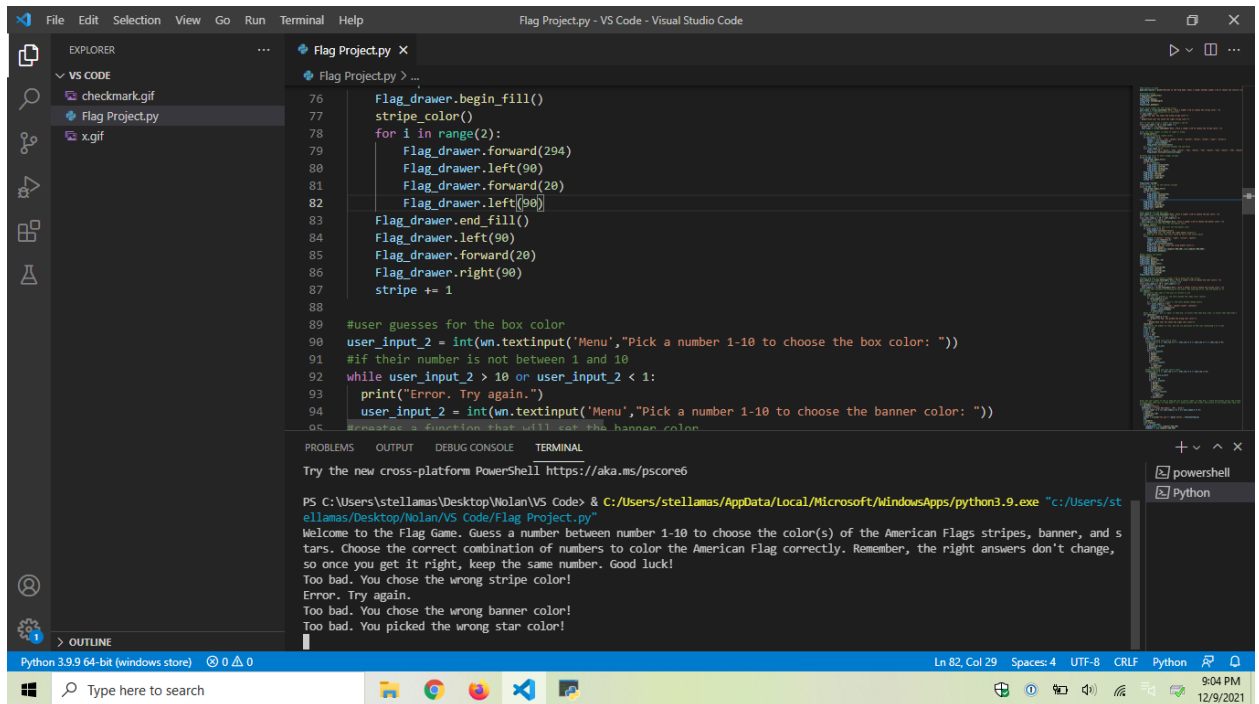

(The input on the window shows up again, and on the terminal it prints “Error. Try again.”)

- When you guess the right wrong numbers for the stripes, stars, and banner, it will choose random colors, and print ‘You lost.’ on the window. After three seconds, an X will move across the screen. It will also tell you what you got wrong, or right (in this case, everything is wrong.)

4. However, if you get all the numbers right, this is how it looks. The checkmark will move across the screen after 3 seconds, and on the window it will say "You won!!!". On the terminal, as shown below, it will tell you that you got all three right.
